Second Draft Meeting Minutes July 8 – 9, 2019, Atlanta, GA

### Minutes

## National Fuel Gas Code Committee Omni Atlanta Hotel at CNN Center Atlanta, Georgia July 8-9, 2019

- 1. Call to Order and Self Introductions: Chair, Frank Mortimer, call the meeting to order and members and guests introduced themselves. (See attached attendance)
- 2. Adoption of Agenda: The agenda was approved as distributed in the 7/1/19 email.
- 3. Announcements:
  - a. Fire alarms and Exits: Participants were made aware of the fire alarms and exists.
  - b. AGA and NFPA Antitrust Guidelines: Participants were made aware of the antitrust guidelines.
- 4. Membership Review:
  - a. ASC Z223 Committee Updates A revised Roster (7-1-19) and committee balance as of 7/1/19 was distributed. The membership roster and interest category balance were reviewed. The committee is in balance in accordance with its operating procedures.
  - b. NFPA 54 Committee Updates The membership roster was reviewed. The NFPA Standards Council is responsible for maintaining committee balance and was noted that it is in balance.
- 5. Approval of Committee Meeting Minutes: The November 2018 full committee meetings minutes were approved as distributed.
- 6. Future Meeting Schedule: The proposed 2019-2020 meeting schedule was reviewed. The committee discussed the need for an off-cycle meeting typically held after the publication of the new edition. The committee determined that the Secretary should hold the suggested November 17-18, 2020, date on the schedule and coordinate with the Chair and NFPA staff as to whether there are enough agenda topics to convene the meeting. The Secretary is also to coordinate with the Chair, based on the future NFPA 54 public input due date, the meeting dates for the 2021 advisory panels and full committee meetings. These meetings are typically held in the fall. The committee suggested a western U.S. location for the next full committee meeting.
- 7. The NFPA staff liaison provided a presentation on the review process and the allowed motion options.

# **ASC Z223**

## COMMITTEE ON NATIONAL FUEL GAS CODE

- 8. Consideration of Public Comment: The committee reviewed and acted on all public comments and developed Second Revisions. The committee actions that result in a second revisions will be the standing action on the letter ballot. Approved actions from the letter ballot will be incorporated into the Second Draft Report. The ASC Z223 committee will placed out for public comment any changes from the First Draft and process any comments in accordance with their operating procedures. NFPA membership will be able to review the Second Draft report and be provided with the opportunity to submit NITMANs for discussion at the NFPA Technical section in 2020. Refer to www.nfpa.org/54 or www.aga.org/nfgc for the Second Revisions Report and for the Report on Public Comments.
- 9. Other Discussions: The committee discussed the following issues:
  - A. Replacement Table 6.3.1(d) The committee approved a second draft revision to replace the current propane pipe sizing table 6.3.1(d) with a corrected version as provided in the meeting materials. It was discovered that the current table is missing pipe length rows 70 ft and 90 ft, and the capacities shown in the table greater than 60 ft are overstated. The reason for this was when all piping tables were recalculated for the 2006 edition's expanded length tables, the capacities were directly copied from an Excel spreadsheet that had the 70 ft and 90 ft increment, resulting in the incorrect assignment of capacities above 60 ft.
  - B. NTSB Recommendation on Methane Detectors Provided in the meeting materials was the preliminary NTSB report provided at their April 23, 2019, public meeting on the building and explosion and fire that occurred in Silver Spring, MD on August 10, 2016. NFPA reported that they have received a letter from NTSB that includes their recommendation that NFPA 54 adopt an installation requirement for methane detectors in all residential buildings. NFPA reported that they have are in the process of forming a new standards committee to develop an installation standard for methane detectors. NFPA is coordinating with GTI and others on the standard's development. It was also reported that the Fire Protection Research Foundation in sponsorship with the American Gas Association is initiating a research project to examine detector performance and their placement within occupancies. There was consensus that NFPA 54 may not be the appropriate standard to address the installation of methane detectors. It was noted that other model building and fire safety code committees have the expertise to determine detector installation effectiveness such as was done for carbon monoxide, smoke, and radon.
  - C. Possible Panel Projects
    - a. Industrial Coverage The committee discussed the need to establish some or all installation requirements for industrial applications separately from residential and commercial requirements. Many requirements appropriate for residential and commercial installations may also impact industrial installation but may not be appropriate. There may be a need for more focused industrial coverage can be

# **ASC Z223**

## COMMITTEE ON NATIONAL FUEL GAS CODE

separated in separate sections or chapters. A Task Group was formed with Franklin Switzer (Chair), Mike Gorham, Gregg Gress, Ted Lemoff, and Andy Thielen. The Task Group was charged to identify the requirements within 54 that may need to be revised to accommodate industrial applications and to draft coverage. Franklin is to develop a work statement and forward to Frank Mortimer for review. Two documents were mentioned that might be of use include the discontinued NFPA 54A and the current Canadian B149.3.

- b. Possible Combining Sections 10.15 Illuminating, and 10.31 Outdoor Decorative Appliances – The Appliance Panel was assigned the task to consider if section 10.15 and 10.31 could be either combined or located near each other. An initial review by the Panel's Chair found that these are appliances are sufficiently different and do not need to be combined. Appliance panel to review further.
- c. NFPA Data Home Cooking Fires A committee member is asking whether there is there interest in reviewing NFPA home cooking fires reports and if so to request the NFPA Fire Analysis Department to develop a report in time for the next Appliance Panel meeting. It was noted that the NFPA statistics include outdoor grill fires and may overstate the number of actual gas in-house home fires. UL reported that they have formed a task group to explore the issue. With UL task group underway the committee determined that there is no need to pursue a sperate action.
- d. Combustion Air and ACH There may be a need to revisit the combustion air requirements to link it to commonly used blower door testing procedures and ASHRAE published air change factors. A Task Group is formed including: Thomas Andrew, Jim Brewer, Paul Cabot, Diane Jakobs, and Andy Thielen. Chair charged the TG to bring a plan to the next committee meeting.
- 10. New Business: No new business was raised. The committee thanked Secretary Cabot for his dedication and service prior to his early 2020 retirement.
- 11. Adjourn: The meeting was adjourned at 9:30AM on July 9.

## NFPA 54 Second Draft Meeting Attendance

## July 8 – 9, 2019

#### **Committee Members in Attendance:**

Frank Mortimer, Chair	Alex Ing, NFPA Staff Liaison
Paul Cabot, Recording Secretary	Thomas Andrews
Jonathan Brania	James Brewer
Thomas Crane	Gerald Davis
Mike Deegan	Mark Fasel
Richard Gilbert	Enrique Gonzalez
Mike Gorham	Gregg Gress
Roger Griffith	Peter Holmes
Diane Jakobs	Jeff Kleiss
Theodore Lemoff	Andrea Papageorge
Phillip Ribbs	April Richardson
Eric Smith	Jason Stanek
Franklin Switzer	Kody Daniel
Ralph Euchner	Pennie Feehan
Jean McDowell	John Puskar
Phillip Stephens	Bruce Swiecicki
Andy Thielen	Kent Thompson
Robert Torbin	Marek Kulik

## **Guests in Attendance:**

Chris Byer, Piedmont Natural Gas	Paul Gugliotta, National Grid
Jim Ranfone, AGA	Kent Thompson, Railroad Commission of Texas
Bill Stultz, EMC Insurance	Matthew Knotts, Piedmont Natural Gas
Shannon Corcoran, AHRI	Jonathan Sargeant, Omegaflex
Larry Gill, Ipex USA LLC	Matthew Tocci, Ipex USA LLC
Gaetano Altomave, Ipex USA LLC	

**NFPA 54**

#### ACCREDITED STANDARDS COMMITTEE ON NATIONAL FUEL GAS CODE, Z223

**SCOPE:** Development of a safety code for gas piping systems on consumers' premises and the installation of gas utilization equipment and accessories for use with fuel gases such as natural gas, manufactured gas, liquefied petroleum gas in the vapor phase, liquefied petroleum gas-air mixtures, or mixtures of these gases, including:

- a. The design, fabrication, installation, testing, operation and maintenance of gas piping systems from the point of delivery to the connections with each gas utilization device. Piping systems covered by this code are limited to a maximum operating pressure of 125 psig. For purposes of this code, the point of delivery is defined as the outlet of the meter set assembly or the outlet of the service regulator or service shutoff valve where no meter is provided.
- b. The installation of gas utilization equipment, related accessories, and their combustion air and venting systems.

Public Input N	lo. 23-NFPA 54-2021 [ Section No. 1.1.1.2 ]
1.1.1.2	
This code shall r	not apply to the following items:
(1) Portable LP	-Gas appliances and equipment of all types that are not connected to a fixed fuel piping system
(2) Installation	of appliances such as brooders, dehydrators, dryers, and irrigation equipment used for agricultural purposes
(3) Raw materia	al (feedstock) applications except for piping to special atmosphere generators
(4) Oxygen–fue	I gas cutting and welding systems
(5) Industrial ga oxygen, and	is applications using such gases as acetylene and acetylenic compounds, hydrogen, ammonia, carbon monoxide, I nitrogen
	efineries, pipeline compressor or pumping stations, loading terminals, compounding plants, refinery tank farms, gas processing plants
	ated chemical plants or portions of such plants where flammable or combustible liquids or gases are produced by actions or used in chemical reactions
(8) LP-Gas inst	allations at utility gas plants
(9) Liquefied na	tural gas (LNG) installations installations other than fuel gas systems within the scope of NFPA 54
(10) Fuel gas pip	ing in electric utility power plants
(11) Proprietary	tems of equipment, apparatus, or instruments such as gas generating sets, compressors, and calorimeters
(12) LP-Gas equ	ipment for vaporization, gas mixing, and gas manufacturing
	ng for buildings under construction or renovations that is not to become part of the permanent building piping nat is, temporary fixed piping for building heat
(14) Installation	of LP-Gas systems for railroad switch heating
(15) Installation	of LP-Gas and compressed natural gas (CNG) systems on vehicles
	meters, gas pressure regulators, and other appurtenances used by the serving gas supplier in distribution of gas, ndiluted LP-Gas
(17) Building des	ign and construction, except as specified herein
(18) Fuel gas sy	stems on recreational vehicles manufactured in accordance with NFPA 1192
(19) Fuel gas sy	stems using hydrogen as a fuel
(20) Construction	n of- and maintenance of appliances
(9) The exclusion of heaters and other a	em and Substantiation for Public Input LNG plants from the requirements of the Code is revised to recognize that LNG plant use fuel gas or for boilers, fire pplications. This proposal was developed in conjunction with a task force of the LNG committee. application. Maintenance of appliances is also not covered in NFPA 54.

**4.4\* Noncombustible Material.** A material that complies with any of the following shall be considered a noncombustible material:

- A material that, in the form in which it is used and under the conditions anticipated, will not ignite, burn, support combustion, or release flammable vapors when subjected to fire or heat.
- (2) A material that is reported as passing ASTM E136, Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750°C.
- (3) A material that is reported as complying with the pass/fail criteria of ASTM E136 when tested in accordance with the test method and procedure in ASTM E2652, Standard Test Method for Behavior of Materials in a Tube Furnace with a Cone-shaped Airflow Stabilizer, at 750°C.

3.3.84.2 Draft (	Control Regulator
A listed dampe	r device attached to a chimney, vent connector, breeching, or flue gas manifold to control the vent, vent connector source.
atement of Prob	em and Substantiation for Public Input
	ers or draft control devices are usually placed inside the chimney, vent or vent connector to automatically maintain the outlet pressure. These devices are common and should be addressed by NFPA 54.
. equired appliance	buttet pressure. These devices are common and should be addressed by NFPA 54.

Public Input I	No. 43-NFPA 54-2021 [ Section No. 5.4.4 ]
5.4.4 Maximum	Operating Pressure in Buildings.
The maximum o	perating pressure for any piping systems located inside buildings shall not exceed 5 psi (34 kPa) unless one or wing conditions are met:
(1) * The piping	joints are welded or brazed.
	s joined by fittings listed to ANSI LC 4/CSA 6.32, <i>Press-Connect Metallic Fittings for Use in Fuel Gas Distribution</i> nd installed according to the manufacturer's installation instructions.
(3) The piping j	oints are flanged and all pipe-to-flange connections are made by welding or brazing.
(4) The piping i	s located in a ventilated chase or otherwise enclosed for protection against accidental gas accumulation.
(5) The piping i	s located inside buildings or separate areas of buildings used exclusively for one of the following:
(6) Industri	ial processing or heating
(7) <u>Resear</u>	
(8) Warehousin	8
(a) Boiler or n	nechanical rooms
	s a temporary installation for buildings under construction.
() 0	serves appliances or equipment used for agricultural purposes.
( ) 0	system is an LP-Gas piping system with an operating pressure greater than 20 psi (138 kPa) and complies with
NFPA 58.	system is an Li -Gas piping system with an operating pressure greater than 20 psi (150 kr a) and complies with
ement of Probl	em and Substantiation for Public Input
hrough them which nhance the cause angers. Welding th	es can be large in volume compared to natural gas loads, they also have lots of material handling equipment movin can compromise piping systems. There have been many unit heaters and piping systems hit by forklift trucks. It wo of safety to require this piping to be welded. It makes no sense to allow warehouses this exemption and not air craft his piping in warehouses would not be burdensome considering that they are typically space heat loads and not a la piping would need to be above 5 psig.

7.1.7.3.1	
	be one of the following:
	pecifically designed for that purpose
	opper conductor not less than 14 AWG
. ,	
(3) <u>Tracer wire</u>	listed and labeled in accordance with UL 2989
tement of Probl	em and Substantiation for Public Input
UL 2989 was develo	oped to establish specific construction and performance testing criteria to determine the suitability of wire for use
	etectable tracer wire.
The tests include:	
The tests include: • Physical Propertie	s of Insulation
<ul> <li>Mechanical Water</li> </ul>	
<ul> <li>Cold-Bend Test</li> </ul>	•
<ul> <li>Crushing Resistan</li> </ul>	
Impact Resistance	
Unwinding of Low	
Dielectric-Voltage	Winstand
Including the specif	ic reference to UL 2989 clarifies what products are specifically designed for the specific purpose of tracer wires. UL
	nufacturers that have tracer wire listed to
UL 2989.

## Public Input No. 76-NFPA 54-2021 [Section No. 7.3.5.2] 7.3.5.2 Other Occupancies. In other than industrial occupancies and where approved-by the authority having jurisdiction, gas piping embedded in concrete floor slabs constructed with Portland cement shall be surrounded with a minimum of 11/2 in. (38 mm) of concrete and shall not be in physical contact with other metallic structures such as reinforcing rods or electrically neutral conductors. All piping, fittings, and risers shall be protected against corrosion in accordance with 7.2.2. Piping shall not be embedded in concrete slabs containing quickset additives or cinder aggregate. Statement of Problem and Substantiation for Public Input Revised to substitute "approved" for "approved by the Authority Having Jurisdiction (AHJ). The term is redundant as "Authority Having Jurisdiction" (AHJ) is defined in 3.3.2 as being acceptable to the AHJ. The term "approved" is used 39 times in the Code in 5.5.7.2, 5.5.7.3, 5.14 (1), 7.1.5 (1), 7.1.6 (1), 7.2.1 (2), 7.3.5.1, 7.11.6.1, 8.1.1.4, 8.1.5.2 (2x), 9.1.1 (2x), 9.6.5, 9.6.6.2, 10.2.5, 10.3.4 Exception No. 2, 10.3.5, 10.3.7, 10.3.6, 10.3.7, 10.14.2.2 (3) and (4), 10.20.3, 10.21.2 Exceptions No. 1 and No. 2, 10.28, 12.3.2.1, 12.6.1.3 (1) and (3), 12.8.1, 12.8.3.3 (3), 12.9.2, 12.11.6.3 (3), 12.13.2.1 (2x), 12.16 (2) and (5), 13.1.9, 13.2.18. **Submitter Information Verification** Submitter Full Name: Theodore Lemoff **Organization: TLemoff Engineering** Affiliation: None Street Address: City: State: Zip: Submittal Date: Mon May 10 15:02:06 EDT 2021 Committee: NFG-AAA

# Public Input No. 86-NFPA 54-2021 [Section No. 9.3.1.5] 9.3.1.5 Where Combustion air system design and function shall be validated and documented with an acceptance test where all exhaust fans, clothes dryers, and-kitchen ventilation systems interfere with the operation of appliances, make-up air shall be provided systems and all air consuming appliances are operated simultaneously and carbon monoxide readings are taken at flue gas outlets to verify operation within manufacturers acceptable range. 9.1.3.6 Where the combustion air systems acceptance test fails the combustion air system will be redesigned and retested until it can be demonstrated to provide safe appliance operations . Statement of Problem and Substantiation for Public Input The previous language was not enforceable. Every year there are many deaths and injuries related to carbon monoxide. This could help. Calling out the need for someone to have to add make-up air as the only remedy, is confusing, It seems to imply a mechanical make-up air system when what we really mean is by any of the methods we identify. Everyone has seen instances where very little thought is given to proper combustion air, and its not just about design, its about, "does it really work", lots of things can get screwed up in the installation part. A test, a demonstration, a witnessing of commissioning, is the only thing that gets this done and proven. **Submitter Information Verification** Submitter Full Name: John Puskar Organization: Prescient Technical Services L Street Address: City: State:

## Public Input No. 68-NFPA 54-2021 [ Section No. 10.17.2 ] 10.17.2 Protection Above Domestic-Residential Units. Domestic Residential open-top broiler units shall be provided with a metal ventilating hood not less than 0.0122 in. (0.3 mm) thick with the following clearances: 10.17.2.1 \_ a clearance of not less than ¼ in. (6 mm) between the hood and the underside of combustible material or metal cabinets.-A 10.17.2.2 A clearance of at least 24 in. (610 mm)- shall be maintained- between the cooking top and the combustible material or metal cabinet, and the hood shall be at least as wide as the open-top broiler unit and centered over the unit.- Domestic 10.17.2.3 Residential open-top broiler units incorporating an integral exhaust system and listed for use without a ventilating hood shall not be required to be provided with a ventilating hood if where installed in accordance with 10.13.3.1(1). Statement of Problem and Substantiation for Public Input The terms residential and domestic are used in the code and appear to mean the same thing. These terms are both used in appliance standards to mean use in residences, and not commercial or industrial occupancies. Examples: ANSI Z21.8, Installation of Domestic Gas Conversion Burners, UL 103, Chimneys, Factory-Built, Residential Type and Building Heating Appliances. ANSI Z21.1 Household Cooking Gas Appliances, use "domestic" and does not use "residential". The term "residential occupancy" is used in building codes As the term "residential" is well understood, and the term "domestic" is not as well understood. The requirement is separated into multiple paragraphs per the NFPA Manual of Style. A.5.3.2.1	
Some older appliances do not have a nameplate. In this case Table A.5.3.2 used. The input can be based on the following:	.1 or an estimate of the appliance input should be
(1) A rating provided by the manufacturer	
(2) The rating of similar appliances	
<ul><li>(3) Recommendations of the gas supplier</li></ul>	
<ul><li>(4) Recommendations of a qualified agency</li></ul>	
(6) Measurement of the orifice size of the appliance	
The requirement of 5.3.1 that the piping system provide sufficient gas to each	ch appliance inlet must be complied with.
Table A.5.3.2.1 Approximate Gas Input for Typical Appliances	
Appliance	Input Btu/hr (Approx.)
Space Heating Units	
Warm air furnace	-
Single family	100,000
Multifamily, per unit	60,000
Hydronic boiler	-
Single family	100,000
Multifamily, per unit	60,000
Space and Water Heating Units	
Hydronic boiler	-
Single family	120,000

Water Heating Appliances	-
Water heater, automatic storage 30 gal to 40 gal tank	35,000
Water heater, automatic storage 50 gal tank	50,000
Water heater, automatic instantaneous	-
Capacity at 2 gal/min	142,800
Capacity at 4 gal/min	285,000
Capacity at 6 gal/min	428,400
Water heater,- domestic <u>residential</u> , circulating or side-arm	35,000
Cooking Appliances	-
Range, freestanding, <del>domestic <u>residential</u> Built is such as built a such a single stick and the second start of the second start of the second start of the</del>	65,000
Built-in oven or broiler unit, <del>domestic <u>residential</u> Built in ten unit, domestic residential</del>	25,000
Built-in top unit, <del>domestic <u>residential</u></del>	40,000
Other Appliances	-
Refrigerator	3,000
Clothes dryer, Type <del>1 (domestic) <u>1</u></del>	35,000
Gas fireplace direct vent	40,000
Gas log Barbecue	80,000
Gas light	40,000 2,500

### Statement of Problem and Substantiation for Public Input

The terms residential and domestic are used in the code and appear to mean the same thing. These terms are both used in appliance standards to mean use in residences, and not commercial or industrial occupancies. Examples:

ANSI Z21.8, Installation of Domestic Gas Conversion Burners, UL 103, Chimneys, Factory-Built, Residential Type and Building Heating Appliances.

ANSI Z21.1 Household Cooking Gas Appliances, use "domestic" and does not use "residential". The term "residential occupancy" is used in building codes This proposal substitutes "residential" for "domestic" in 4 locations, and deletes "(domestic) after Clothes dryer, Type 1. The term "Type 1" clothes dryer is used in the code and the reference to either domestic or residential is not needed in this location.

## PMG LISTING CRITERIA FOR INTERNAL EPOXY BARRIER COATING MATERIAL FOR REHABILITATION OF METALLIC FUEL GAS PIPE

## LC1045

### Approved Date: December 2020

## PREFACE

Plumbing, mechanical and fuel gas (PMG) listings issued by ICC Evaluation Service, Inc. (ICC-ES), are based upon performance features of the *International Plumbing Code*<sup>®</sup>, *International Mechanical Code*<sup>®</sup>, *International Residential Code*<sup>®</sup>, *Uniform Plumbing Code* and Uniform Mechanical Code. Section 105.2 of the *International Plumbing Code*<sup>®</sup> reads as follows:

Alternative materials, methods and equipment. The provisions of this code are not intended to prevent the installation of any material or to prohibit any method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material or method of construction shall be approved where the code official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability and safety.

Similar provisions are contained in the Uniform Codes.

ICC-ES may consider alternate listing criteria, provided the listing applicant submits valid data demonstrating that the alternate listing criteria are at least equivalent to the listing criteria set forth in this document, and otherwise demonstrate compliance with the performance features of the codes. Notwithstanding that a product, material, or type or method of construction meets the requirements of the criteria set forth in this document, or that it can be demonstrated that valid alternate criteria are equivalent to the criteria in this document and otherwise demonstrate compliance with the performance features of the codes, ICC-ES retains the right to refuse to issue or renew a listing, if the product, material, or type or method of construction is such that either unusual care with its installation or use must be exercised for satisfactory performance, or if malfunctioning is apt to cause unreasonable property damage or personal injury or sickness relative to the benefits to be achieved by the use of the product, material, or type or method of construction.

Listing criteria are developed solely for use by ICC-ES for purposes of issuing ICC-ES PMG listings.

#### 1.0 INTRODUCTION

**1.1 Purpose:** The purpose of this listing criteria is to establish requirements for internal epoxy barrier pipe coating materials for rehabilitation of metallic fuel gas pipe to be recognized in an ICC Evaluation Service, Inc. (ICC-ES), listing.

**1.2 Scope:** This listing criteria is intended to establish the minimum criteria necessary for the use of a proprietary, mechanically mixed, blended, epoxy barrier coating that is mechanically applied to the interior of above and below ground ½" to 2" rigid metallic fuel gas pipe within the building footprint. This epoxy barrier coating is intended for use in pipelines that transport natural (NG) and liquid propane (LP) gases, where resistance to gas permeation, ground movement, internal corrosion, leaking joints, pinholes, and chemical attack are required. Any non-metallic pipe sections, and any gasketed connections or valves shall be removed before coating and replaced as applicable after coating installation. These criteria do not address the coating of plastic, corrugated, or other flexible gas pipe.

**1.2.1** The coating shall not be installed on non-metallic pipe or main gas line applications.

**1.2.2** In the case of a remediated metallic fuel gas pipe, the internal coating is intended to be adherent to the substrate and to act as a barrier coating with respect to the prevention of internal corrosion and the sealing of minor pinhole leaks. The coating is not intended (or expected) to function in any kind of structural capacity, other than the sealing of threaded joints and sealing of limited pin-hole corrosion (within the range of the calculated allowable leakage), with the primary gas pressure containment continuing to be provided by the structural host pipe.

#### 1.3 Codes and Referenced Standards:

Note: Any standard referenced herein shall be the current edition of that standard. In instances where the applicable code references a different edition of a given standard, the applicant shall also provide documentation of conformance with the code referenced standard edition.

**1.3.1** International Fuel Gas Code<sup>®</sup> (IFGC). International Code Council.

1.3.2 International Residential Code<sup>®</sup> (IRC). International Code Council.

**1.3.3** ASTM B117, Standard Practice for Operating Salt Spray (Fog) Apparatus, ASTM International.

**1.3.4** ASTM D543, Standard Practices for Evaluating the Resistance of Plastics to Chemical Reagents, ASTM International.

**1.3.5** ASTM D638, Standard Test Method for Tensile Properties of Plastics, ASTM International.

**1.3.6** ASTM D714, Standard Test Method for Evaluation of Blistering of Paints, ASTM International.

**1.3.7** ASTM D1434, Standard Test Method for Determining Gas Permeability Characteristics of Plastic Film and Sheeting, ASTM International.

**1.3.8** ASTM D2240, Standard Test Method for Rubber Property — Durometer Hardness, ASTM International.

**1.3.9** ASTM D2247, Standard Practice for Testing Water Resistance of Coatings in 100% Relative Humidity, ASTM International

**1.3.10** ASTM D3167, Standard Test Method for Floating Roller Peel Resistance of Adhesives, ASTM International

**1.3.11** ASTM D4541, Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Testers, ATM International (see alternative ISO 4624)

**1.3.12** ASTM D5402, Standard Practice for Assessing the Solvent Resistance of Organic Coatings using Solvent Rubs, ASTM International

**1.3.13** ASTM E2105, Standard Practice for General Techniques of Thermogravimetric Analysis (TGA) Coupled with Infrared Analysis (TGA/IR), ASTM International.

**1.3.14** ASTM G62, Standards Test Methods for Holiday Detection in Pipeline Coatings, ASTM International.

**1.3.15** AWWA C210, Liquid-Epoxy Coating and Lining for Steel Water Pipe and Fittings, American Water Works Association.

**1.3.16** CAN-CSA-Z245.20, Plant-Applied External Coatings for Steel Pipe, CSA Group.

**1.3.17** ISO 8503-1, Preparation of steel substrates before application of paints and related products — Surface roughness characteristics of blast-cleaned steel substrates — Part 1: Specifications and definitions for ISO surface profile comparators for the assessment of abrasive blast-cleaned surfaces, ISO.

**1.4** Definitions: Definitions shall be in accordance with the referenced standards.

#### 2.0 BASIC INFORMATION

**2.1 Product Description:** A proprietary, mechanically mixed, blended, epoxy barrier coating system that is applied by an air vortex to the interior of above and below ground rigid metallic fuel gas pipe within the building footprint.

**2.1.1 Product and Packaging Identification:** The product packaging shall be permanently and legibly marked with the manufacturer's name or trademark, and the product name. The product shall bear the PMG® listing mark. The ICC-ES listing number shall be placed on the listed product's packaging or installation instructions. The methods of field identification of the lined piping shall be specified.

**2.2 Applicability for Use:** The minimum barrier coating wall thickness, pipe sizes that can be coated and piping material and existing piping imperfections that can be coated shall be in accordance with the manufacturer's specifications.

2.3 Condition Assessment and Applicability for Use: The system manufacturer's installation instructions shall specify the required host pipe condition assessment measures.

**2.3.1** Host Pipe Condition Assessment – External: A visual external piping survey of as close to 100% as possible of the existing, exposed (not concealed within the structure of the building) pipework to be coated shall be undertaken to identify any signs of external corrosion or damage.

**2.3.1.1 Wall Thickness Loss – External**: Where external corrosion is identified, an assessment of its extent shall be completed by estimating the % loss of wall thickness. The estimated % loss of wall thickness shall be calculated by dividing the depth of any external corrosion by the wall thickness of the pipe.

#### Example:

Depth of corrosion measured with a pit gauge = 2mm

Wall thickness of pipe without corrosion = 2.9mm

% loss of wall thickness = (2/2.9) x 100 = 68%

Any external corrosion location with calculated wall thickness loss greater than 50% shall be deemed unsuitable for coating. Note: Localized pin-holing that does not exceed the Permissible Leakage Limit requirements, as described below, may be coated. **2.3.1.2: Inaccessible Pipes**: Where entry to any location within the building prevents the external visual inspection of the pipework, a decision will be made after consultation with the building and/or asset owner as to whether to proceed with the coating process.

**2.3.2** Host Pipe Condition Assessment – Internal: By assessing the level of internal corrosion and cleaning requirements, combined with measuring the pre-renovation leakage rate of the pipe, the installing contractor can further assess the host pipe condition to determine applicability for coating.

**2.3.2.1 Permissible Leakage:** The coating system manufacturer's installation instructions shall include a means of Pressure Loss Analysis with Permissible Leakage Limit requirements for the host piping system as an additional assessment of the condition of the host pipe and the applicability for coating.

2.3.2.1.1 **Permissible Leakage Calculator:** The system manufacturer shall provide a scientifically validated Permissible Leakage Calculator for use with their coating system to determine whether the barrier coating can be successfully applied to the interior of a host pipe system. The Permissible Leakage Calculator shall rely upon site measured pressure drops in proportion to the volume of the pipe to determine a volume threshold ( $m^3 hr^{-1}$ ) which shall dictate applicability for use.

2.3.2.1.2 **Leakage Point Repairs:** Localized host pipe repairs can be utilized to bring the permissible leakage within acceptable tolerances.

2.4 Installation Instructions: The barrier coating shall be installed in accordance with the manufacturer's instructions, and the applicable requirements of the relevant codes and reference standards in Section 1.3. The system manufacturer's installation instructions shall specify the certification requirements for the installing contractor (which shall include a training program) and the required equipment and means for proper installation. The system manufacturer's installation instructions shall specify the pre-coating field preparation measures, the parameters governing the proper application of the coating, and the post-installation pipe system labeling requirements.

**2.4.1** Host Pipe Preparation for Coating: The system manufacturer's installation instructions shall include a description of the required methods of host pipe condition assessment and suitable methods of host pipe preparation (cleaning and ensuring an adequate "anchor tooth").

**2.4.1.1 Pipe Cleaning:** The manufacturer's installation instructions shall include guidance regarding the visual observation of the quality and cleanliness of the pipe to be coated.

2.4.1.1.1 As a minimum requirement, the cleaned surface, when viewed without magnification, shall be free of visible concentrations of oil, grease, dirt, mill scale, rust, and previously applied, disbonded coatings. Evenly dispersed, very light shadows, streaks, and discolorations caused by stains of mill scale, rust and old coatings shall be permitted to remain on no more than 33 percent of the surface. Slight residues of rust and old coatings shall be permitted to be left in the craters of pits if the original surface is pitted.

2.4.1.1.2 After host pipe preparation, the contractor shall use a visual field comparator as per ISO 8503-1 and manufacturer's specifications to verify proper anchor tooth at a minimum of either 4 locations or 25% of the entry and exit points, whichever is greater.

**2.4.2 Pipe Coating:** The manufacturer's installation instructions shall be followed and shall include instructions on proper resin mixing procedures, coating application parameters (including volume calculators and shot plans), identification of key "hold and witness" points for quality assurance during construction, and piping system reassembly and recommissioning requirements.

2.4.3 **Post-Installation Labeling:** The manufacturer's installation instructions shall include a requirement for labeling the system to indicate that an epoxy coating has been applied to the piping. The labeling shall include a prohibition on the use of flame or heat to repair any part of the piping system. The label shall indicate the name of the manufacturer of the coating and shall include a disclaimer not to replace the pipes without contacting the coating manufacturer. The labels can either be permanent decals or tags approved by the Authority Having Jurisdiction and shall be located outside of the pipe at all valves changed outs, at curb stop valves, at pipe access points and in systems along pipes at intervals not to exceed 20 feet except for existing piping located in concealed and inaccessible areas.

#### 3.0 SYSTEM QUALIFICATION AND PERFORMANCE REQUIREMENTS

**3.1 Test Samples**: Qualification test pipe samples shall be prepared by the coating system manufacturer for each applicable host pipe material specified by the manufacturer; steel panels are also prepared by the coating system manufacturer for generalized representative qualification testing. Each of the samples shall be coated according to the manufacturer's installation instructions and allowed to cure for 24 hours at room temperature. The samples shall be subjected to the tests specified in Sections 4.2 through 4.5.

**3.1.1 Sample Preparation:** Manufacturer pipe samples and steel panels required for laboratory testing are to be suitably coated for use as representative samples to simulate the quality of the as-built coating system intended for use in the piping system. Preparation of the sample surface prior to coating may include abrasive blasting to achieve a proper surface profile. The desired "anchor tooth" reading will be determined by the manufacturer as per field application specifications. A wet film preparation device such as a Film Coating Applicator can be used to evenly apply the epoxy onto the surface of the test panel.

**3.2 Qualification Testing Submittals**: The qualification (validation) test data used to qualify a coating system for use is not project performance specific, but rather system design specific. These tests shall be recognized as qualification tests to be performed once for each class of installed coating and do not require repeating unless the materials and/or methods are altered; qualification testing requirements are explicitly not intended to be used as post-construction field verification requirements.

**3.2.1** Thickness Measurement: After curing, the coating thickness shall be measured using an appropriate device for determining Dry Film Thickness (DFT) of coatings. Coatings shall meet the minimum required thickness within the allowable tolerance range [e.g. 250 microns (allowable tolerances of +1000/-90)]. DFT readings shall be taken from at least four points evenly distributed around the test sample. For example: 3, 6, 9, & 12 o'clock for pipe samples.

**3.2.2 Pull-off Adhesion Strength Test:** A manufacturer's plate sample shall be laboratory tested for resistance to pull-off of the epoxy barrier coating in accordance with ASTM D4541. The minimum pull-force adhesion shall be 2500 psi, as per Protocol 2. (Note that the precision and bias statements for this test show considerable variability across round robin testing results.)

**3.2.3 Hardness Test:** A manufacturer's plate sample shall be laboratory tested in accordance with ASTM D2240 for durometer hardness. The hardness of the coating shall comply with the manufacturer's published tolerances.

**3.2.4** Chemical Resistance Test: Manufacturer prepared samples shall be laboratory tested according to ASTM D 543, Practice B for resistance to the chemicals listed in table 1. Weight of the test specimens shall not increase by more than 14% nor decrease by more than 3% and test specimens shall retain at least 80% both of its hardness, when measured in accordance with Test Method ASTM D2240, and of peeling strength, when measured in accordance with Test Method ASTM D3167.

**Table 1: Chemical Resistivity List of Reagents** 

Liquids	Test Composition	
Water (External and Internal)	Freshly prepared distilled water (in accordance with Practice D 543)	
Gasoline (External)	Gasoline-Automotive Spark-Ignition Engine Fuel per Specification D 4814	
Gas Condensate (Internal)	70 % volume isooctane + 30 % volume toluene	
Methanol	20 % volume methanol + 80 % volume distilled water	
Triethylene Glycol	10 % volume triethylene glycol + 90 % volume distilled water	
Brine Solution	10 % mass NaCl solution made up with a balance of distilled water	
Mineral Oil	100 % White Mineral Oil USP, specific gravity 0.830 to 0.860, Saybolt at 100°F: 125 to 135 s, in accordance with Practice D 543	
Isopropanol	10 % volume isopropanol + 90 % volume distilled water	
Sulfuric Acid	5 % weight (of total solution) H <sub>2</sub> SO <sub>4</sub> in distilled water	
Surfactants	5 % mass (of solution weight) dehydrated pure white soap flakes (dried 1 h at 105°C) dissolved in distilled water, in accordance with Practice D 543	
Mercaptans	2 % volume tertiary butyl mercaptan + 98 % volume mineral oil, white, USP	

**3.2.5 Gas Blistering:** A manufacturer's test panel shall be laboratory tested for gas blistering and appearance in accordance with ASTM D714.

**3.2.5.1 Humidity resistance**: A manufacturer's test panel shall be laboratory tested with 100% relative humidity exposure as specified in ASTM D2247 for 500 hours. There shall be no blistering or delamination.

- **3.2.7** Salt spray resistance: A manufacturer's test panel shall be subjected to salt spray conditioning as specified in ASTM B117 for 500 hours. There shall be no blistering, delamination.
- 3.2.8 Gas Permeability: A manufacturer's test panel shall be subjected to laboratory testing for gas permeability in accordance with ASTM D1434. For reference data only because there is no pass or fail requirement.
- **3.2.9 Evolved Gas Analysis:** A manufacturer's test panel shall be subjected to laboratory testing for evolved gas analysis in accordance with ASTM E2105.
- **3.2.10 Rating Class Determination**: A manufacturer's test panel shall be subjected to micro-sectioning in accordance with CAN-CSA-Z245.20 to evaluate the rating class.
- **3.2.11 Cissing and Pin Holing**: A manufacturer's test panel shall be subjected to laboratory testing for Holiday Detection in accordance with Method A of ASTM G62.
- 3.2.12 Cure Schedule Determination: The manufacturer's Recommended Cure Schedules shall be supported by laboratory validation testing in accordance with ASTM D5402 with a minimum of 10 "double rubs" using isopropyl alcohol in order to qualitatively validate an adequate cure schedule for safe return to service.

- 3.2.13 Validation of Construction Thickness: The ability to deliver the specified coating thickness shall be scientifically validated.
  - 3.2.13.1 A test assembly simulating typical site conditions shall be set up for coating application utilizing a 1-inch-diameter pipe that is 50 feet in length. Fittings shall be used to simulate an actual installation.
  - **3.2.13.2** The test assembly shall be coated in accordance with the coating tables in the manufacturer's installation instructions.
  - **3.2.13.3** The coated assembly shall be allowed to cure at room temperature for 24 hours.
  - 3.2.13.4 The thickness of the coating shall be measured at both the last fitting and at the outlet end of the test assembly. The minimum "as-built" coating thickness shall be as specified by the manufacturer [e.g. 250 microns] with an allowable tolerance of +1000 / -90 microns.
  - 3.2.13.5 A mathematical evaluation of the coating tables in the manufacturer's installation instructions shall be performed, based on the test results for the 1-inch pipe, to confirm that the minimum coating thickness can be provided.

#### 4.0 QUALITY CONTROL / VERIFICATION TEST METHODS AND REQUIREMENTS

Post-construction, representative samples from the project shall verify as-built compliance with the key performance property requirements.

**4.1 Post-Construction Thickness Verification:** Field thickness verification measurements shall be performed at every entry and exit point with Dry Film Thickness (DFT) readings taken from at least four points evenly distributed around the pipe ends to verify performance compliance of the epoxy barrier coating material with the required minimum thickness. The minimum "as-built" coating thickness shall be as specified by the manufacturer [e.g. 250 microns] with an allowable tolerance of +1000 / -90 microns.

#### 4.2 Verifying Safe Return to Service

**4.2.1 CCTV visual inspection**: The contractor shall internally inspect as much of the coated piping system as is practical with a CCTV camera system to visually confirm proper application. A recording of the CCTV inspections shall be provided.

**4.2.2 Epoxy cure verification**: Adequate curing for safe return to service shall be field verified at every entry and exit point with 10 "double rubs" with isopropyl alcohol inside the coated pipe, as per ASTM D5402.

**4.2.3 Pressure test:** Prior to acceptance and return to operation, all sections of the coated piping system shall be pressure tested in accordance with the requirements of Section 406 (IFGS) "Inspection, Testing, and Purging" of the ICC International Fuel Gas Code.

#### 5.0 LISTING RECOGNITION

**5.1** The listing shall state that this coating process is not approved as a method for structurally repairing and concealing large fractures, holes, leaks or other structural imperfections in the piping system; the primary gas pressure containment will continue to be provided by the host pipe.

5.2 The listing shall specify the minimum thickness of the epoxy barrier coating material.

**5.3** The listing shall specify the type of rigid pipe material allowed to be coated with the epoxy barrier coating and shall not be applied for operation across fittings or joints which are designed to allow mechanical flexibility in the system.

**5.4** The listing shall specify the minimum and maximum pipe (1/2" to 2") which may be lined with the applicant's system.

**5.5** The listing shall contain flow tables identifying the flow rate and pressure drop at various velocities. (waiting to hear back if this is possible with coated pipes transporting gas)

**5.6** The listing shall contain the minimum surface preparation requirements for the inside wall of the pipe prior to coating of the pipe or tubing.

**5.7** The listing shall state that the installing contractor must be trained and certified by the coating manufacturer and only personnel or contractor's approved and authorized by the manufacturer of the coating system are allowed to use the process approved under the evaluation report.

**5.8** The listing shall state that all non-metallic components, as well as gasketed joints, and valves shall be removed prior to installation of the coating.

5.9 The listing shall state that corrugated metal pipe are outside of the scope of evaluation.

5.10 The coating shall not be used on plastic, corrugated, or other flexible fuel gas pipe.

**5.11** The SDS or TDS shall include the flashpoint data for the raw resin, as per the SDS or TDS for the raw material supplier's resin.

**5.12** The listing shall state that the contractor shall internally inspect as much of the coated piping system as is practical with a CCTV camera system to visually confirm proper application and pressure tests for leaks in the presence of the code official or the official's designated representative. In addition, the system shall be approved for the intended purpose by the authority having jurisdiction. Technical documentation shall be submitted to the authority having jurisdiction.

**5.13** The listing shall state that all appliances shall be disconnected prior to the installation of the coating and the appliances shall not be reinstalled until after full curing has occurred. Any older or damaged valves are to be replaced with applicable code approved valves for the flow and pressure demand in the system. Appliances shall be turned on and observed for proper operation after installation.

**5.14** The listing shall state that the epoxy barrier coating shall only be used in pipelines that transport natural (NG) and liquid propane (LP) gases.

# **COMMITTEE ON NATIONAL FUEL GAS CODE**

**NFPA 54** 

## Attachment 5

Safety Recommendation P-19-007 From NTSB and Correspondence NFPA 54 National Fuel Gas Code Technical Committee: Review the Safety Recommendation P-19-007 and correspondence between NFPA and NTSB, and develop a response to the NTSB.

NFPA Staff note: A draft of NFPA 715, Standard for the Installation of Fuel Gases Detection and Warning Equipment, has been developed and the 2023 edition is in the Second Draft stage. The current draft of NFPA 715 covers "the selection, design, application, installation, location, performance, inspection, testing, and maintenance of fuel gas detection and warning equipment in buildings and structures" (1.1.2) and contains "requirements for the selection, installation, operation, and maintenance of equipment that detects concentrations of fuel gases that could pose a life or property safety risk" (1.1.3) but does not require detection systems in any occupancy.

NTSB Safety Recommendation P-19-007: <u>https://data.ntsb.gov/carol-main-public/sr-details/P-19-007</u>

TO THE NATIONAL FIRE PROTECTION ASSOCIATION: In coordination with the Gas Technology Institute and the International Code Council, revise the National Fuel Gas Code, National Fire Protection Association 54 to require methane detection systems for all types of residential occupancies with gas service. At a minimum, the provisions should cover the installation, maintenance, placement of the detectors, and testing requirements.

Response	We note that you have distributed or

Response We note that you have distributed our investigative report, Building Explosion and Fire, Silver Spring, Maryland, August 10, 2016 (PAR-19-01), to the National Fuel Gas Code Technical Committee, who is responsible for NFPA 54, and that you will update us on the committee's actions after it convenes for the next revision cycle. We further note that, during its April 2019 meeting, the NFPA Standards Council approved a new technical committee to develop a standard on residential gas detection that will address the installation and placement of single and multistation residential combustible gas detectors that detect methane and liquefied petroleum gas (propane). The NFPA Council subsequently approved the new technical committee's scope and membership roster at its August 2019 meeting.

We understand that you believe that, in lieu of revising the National Fuel Gas Code, National Fire Protection Association 54 as requested in in our recommendation, creating a standard specifically for residential gas detection devices and systems achieves and exceeds the technical intent of the recommendation. We agree that, once complete, these actions will satisfy Safety Recommendation P-19-7. Pending completion and implementation of a new standard to require methane detection systems for all types of residential occupancies with gas service (to cover, at a minimum, detector installation, maintenance, placement, and testing), Safety Recommendation P-19-7 is classified OPEN--ACCEPTABLE ALTERNATE RESPONSE.

FromNational Fire Protection AssociationToNTSBDate08/27/2019TypeOfficial CorrespondenceResponse-From L. Seth Statler, Director of Government Affairs: The first action we took was thedistribution of the adopted report, NTSBIPAR-19-01, to the National Fuel Gas Code TechnicalCommittee, who are responsible for NFPA 54.

They already were scheduled to meet as part of their Second Draft meeting on the next code revision, but staff believed it was important to provide the committee with early notification of the NTSB recommendation. The report was provided as part of the agenda for the committee's July 8, 2019 meeting. Because this was the Second Draft stage of the code development process, it was not appropriate for them to take action at this time with respect to the recommendation. However, NFPA staff will continue to update NTSB on the actions of this committee when it convenes for the next revision cycle.

Three members of your staff - Julie Perrot, Rachael Gunaratnum, and Sean Lynum - joined NFPA Senior Director Guy Colonna and myself on a conference call held July 26, 2019 to discuss our proposed approach to standards development intended to address the Board recommendation. Several activities are underway to address the NTSB concerns.

Even before learning of the incident and the Board's investigation, NFPA received a "new project initiation request" in August 2018 from a stakeholder active with NFPA 54. In response to incidents like Silver Spring and many others throughout the US, the request seeks action by the NFPA Standards Council to consider establishing a new technical committee to develop a new standard on residential gas detection. Specifically, the request recommends that the new standard address installation and placement of single and multi-station residential combustible gas detectors that specifically detect common fuel gases, such as natural gas (methane) and liquefied petroleum gas (LPG or propane).

The NFPA Standards Council approved the request during its April 2019 meeting, and at its recent August meeting, the Council voted to approve the committee scope and membership roster for this new committee NFPA acknowledges the specific recommendation of the Board, which was to revise NFPA 54 to require residential methane gas detection with requirements addressing installation, maintenance, placement, and testing of detectors. NFPA believes that the alternative strategy to create a stand-alone standard specifically for residential gas detection devices and systems achieves and even exceeds the technical intent of your recommendation for the following reasons:

(1) As outlined in the recommendation, the NFPA 54 committee does not have the requisite expertise to develop new requirements specific to gas detection. For that reason, creating the separate committee with unique expertise only related to residential gas detection assures a final set of requirements that address all aspects of gas detection, including those in the Board's recommendation. Once developed,

NFPA 54 could be revised to refer to this new standard to ensure provisions for gas detection are included in the code in the future. Furthermore, based on comments during our discussion with your staff, the inclusion of a reference to this new residential gas detector standard within NFPA 54 enables widespread implementation of the new requirements due to the broad adoption of NFPA 54 throughout the US. It is also likely that this life safety requirement for residential gas detection could be incorporated into NFPA 101<sup>®</sup>, Life Safety Code<sup>®</sup>, as well as building and fire codes, further ensuring wide adoption.

(2) The Board's recommendation speaks specifically to methane gas detection, while NFPA 54 addresses all fuel gases (flammable gases used for gas fuel-burning appliances), which most commonly includes both natural gas (methane) as well as liquefied petroleum gas (LPG which is generally referred to as propane). NFPA believes that a separate standard that is specific to residential gas detection devices and systems would allow a result that exceeds the Board's recommendation because it covers both common fuel gases and is not limited to methane as Stated in the recommendation. A new gas detection-specific standard would be able to include requirements that recognize and address the gas behavior differences for methane and propane; for example, different lower flammable (explosive) limits (LFL or LEL) and different vapor densities (applies to whether gas rises or sinks upon release). Those two characteristics alone are essential in order to fully meet the provisions defined by the Board's request.

(3) One additional reason for the approach that NFPA has proposed involves a parallel research effort proposed by the same stakeholder who requested the new standards project. The Fire Protection Research Foundation (FPRF) functions as a separate, but affiliated, research arm for NFPA to explore research and data driven answers to questions or problems that emerge from our standards development activities. The FPRF received a request to conduct a study of the placement of the residential gas detectors in order to better guide and inform the standards development process. That project is currently seeking qualified researchers to perform the proposed work. Upon completion the results have the potential to strengthen the requirements developed by the new committee, thus another instance where the proposed NFPA approach would potentially exceed the request in the recommendation.

(4) Because the NFPA consensus standards development process attracts a diverse range of stakeholders, the awareness of this effort is broad and the process affords a forum for the widest representation of interests and stakeholder groups. As part of the ongoing solicitation of committee applicants, NFPA wants the Board to know that both ICC and GTI, co-recipients of the recommendation to address residential gas detection, have applied to the new NFPA technical committee and have been appointed to the committee as of the August Council meeting.

We appreciate the positive feedback from your staff to this alternate approach addressing the Board's recommendation. As discussed during the call, all NFPA committee meetings are open to the public, and we encourage your staff to consider attendance at the initial meeting of this committee as it begins its work in order to brief the committee on the incident, lessons learned and the specifics of the recommendation.

NFPA and its staff cannot control the process or content of any standard to be ultimately developed through our process. However, as we have demonstrated through prior interactions with your Board (high-hazard freight train derailments for example) and the Chemical Safety and Hazard Investigation

Board, we believe a new technical committee formed under ANSI consensus rules will be responsive to the important safety issues NTSB has identified in the P-19-007 recommendation.

Senior Director Guy Colonna intends to provide regular updates to your staff on the progress of these actions that have been initiated. At the same time, as the Director of Government Affairs for NFPA, I stand ready to provide assistance on this or any other issue.

We appreciate the opportunity to work with you, other members of your Board and the NTSB staff. We commend you for the very difficult but important safety role that NTSB performs.

Response The National Transportation Safety Board (NTSB) is an independent federal agency charged by Congress with investigating every civil aviation accident in the United States and significant accidents in other Modes of transportation—railroad, highway, marine, and pipeline. We determine the probable cause of the accidents and issue safety recommendations aimed at preventing future accidents. In addition, we carry out special studies concerning transportation safety and coordinate the resources of the federal government and other organizations to assist victims and their family members affected by major transportation disasters.

We are providing the following information to urge your organization to act on the safety recommendation in this letter because we believe your organization can help reduce the risk of future accidents. For more information about NTSB and our recommendation process, please see the attached one-page summary.

On April 24, 2019, the NTSB adopted its report, Building Explosion and Fire, Silver Spring, Maryland, August 10, 2016, NTSB/PAR-19/01. The details of this accident investigation and the resulting safety recommendations may be found in the attached report, which can also be accessed at http://www.ntsb.gov.

As a result of this investigation, the NTSB identified the following safety issues:

- The location and inspection of service regulators within a structure.
- The inspection of the gas meter assembly.
- The notification of the natural gas odor to Washington Gas Light Company.
- The detection of natural gas through odorants and methane.

Accordingly, the NTSB makes the following safety recommendation to the National Fire Protection Association. Additional information regarding this recommendation can be found in the noted section of the report. • In coordination with the Gas Technology Institute and the International Code Council, revise the National Fuel Gas Code, National Fire Protection Association 54 to require methane detection systems for all types of residential occupancies with gas service. At a minimum, the provisions should cover the installation, maintenance, placement of the detectors, and testing requirements. (P-19-007) (See section 2.5.2.)

The NTSB is vitally interested in this recommendation because it is designed to prevent accidents and save lives. We would appreciate a response within 90 days, detailing the actions you have taken or intend to take to implement this recommendation. When replying, please refer to the safety recommendation by number (for example, P-19-007). We encourage you to submit your response to Correspondence@ntsb.gov. If your reply exceeds 20MB, including attachments, please e-mail us at the same address for instructions on how to send larger documents. Please do not submit both an electronic copy and a hard copy of the same response.
